INTRODUCTION

The *Eastern Shore of Virginia Public Access Assessment & Best Management Practices Plan* aims to provide a comprehensive overview of the public access sites along the Eastern Shore of Virginia, accompanied by shoreline and launch site infrastructure assessments with best management approaches for proactively addressing tidal shoreline erosion. The assessment was conducted using various resources, including the Virginia Institute of Marine Science (VIMS) AdaptVA Viewer and Google Earth. Additionally, site visits were carried out over the course of 18 months to gather firsthand information and assess the condition of each site. Moreover, outreach efforts were made to engage with public access site owners, seeking their input regarding identified needs and potential updates. This collaborative approach ensures that the assessment and plan reflect the perspectives of both stakeholders and the broader community, with the ultimate goal of enhancing public access opportunities in the region.

The VIMS AdaptVA Viewer proved to be an invaluable tool for this assessment. This interactive mapping platform provided detailed information on recommended erosion control strategies, which fall into three categories: living shorelines, traditional approaches, and special considerations. The maps offered a comprehensive view of the region, allowing us to identify existing public access sites, their locations, and surrounding features. These features include, but are not limited to, the presence or tidal marsh, beach, submerged aquatic vegetation (SAV), riparian land cover, bank height, nearshore bathymetry, fetch, and existing shoreline erosion control structures. Leveraging this resource, we were able to analyze the distribution of public access sites, identify gaps in coverage, and prioritize areas for improvement.

To gather accurate and up-to-date information, site visits were conducted at each public access site along the Eastern Shore of Virginia over a period of 18 months. These visits involved thorough assessments of the infrastructure, facilities, and overall condition of each site. Through these on-site inspections, we were able to identify strengths, weaknesses, and potential areas for improvement, which will guide our planning and development efforts.

To ensure the assessment and plan reflect the needs and aspirations of the region, we conducted outreach activities to engage with public access site owners. Through open dialogues and information sharing, we gathered valuable insights regarding the current state of their sites, any challenges they face, and potential updates they would like to see implemented. This collaborative approach not only fosters a sense of ownership among site owners but also enables us to address their concerns and integrate their perspectives into the overall plan.

The *Eastern Shore of Virginia Public Access Assessment & Best Management Practices Plan* is a result of an inclusive and collaborative approach, combining the use of mapping resources such as the VIMS AdaptVA Viewer, comprehensive site visits, and proactive engagement with public access site owners. By leveraging these methodologies, we aim to develop a strategic plan that addresses the identified needs and improves the public access sites along the Eastern Shore of Virginia. This plan will not only enhance recreational opportunities but also promote environmental stewardship, economic growth, and community well-being in the region.
